Product Data Sheet

Flexamat® is a tied concrete block mat used to control erosion in swales, slopes, ditches, channels, shorelines and any area where soil sediment may be lost due to water runoff.

Flexamat® should be considered in any application where consideration is being given to poured concrete, riprap, gabions, ACB's and other hard-armor systems.

Flexamat® consists of pyramidal concrete blocks that are interconnected utilizing a rough-service polyester geogrid. The completed mat yields a high strength, ultra-flexible hard armor system of Erosion Control. Flexamat's superior Percentage of Open Area (POA) affords an ideal zone for vegetation growth while remaining a permanent armor against long-term erosional forces.

NOTES

1. Chain link fence shall be fastened securely to fence posts with wire ties.
2. Filter fabric shall be fastened securely to chain link fence with ties spaced horizontally 24" at the top and midsection.
3. Physical properties of the filter fabric shall conform to the latest edition of THE VIRGINIA EROSION & SEDIMENT CONTROL HANDBOOK.
4. When two sections of filter fabric adjoin each other, they shall be overlapped by 6" and folded.

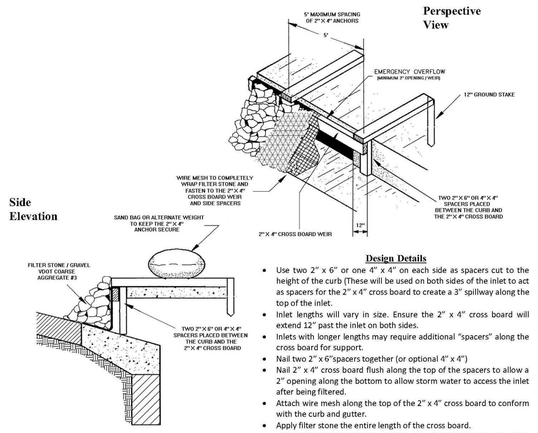
INLET PROTECTION | IP

Recommended Curb Inlet Protection



Design Details

- Use two 2" x 6" or one 4" x 4" on each side as spacers cut to the height of the curb (These will be used on both sides of the inlet to act as spacers for the 2" x 4" cross board to create a 3" spillway along the top of the inlet.
- Inlet lengths will vary in size. Ensure the 2" x 4" cross board will extend 12" past the inlet on both sides.
- Inlets with longer lengths may require additional "spacers" along the cross board for support.
- Nail two 2" x 6"spacers together (or optional 4" x 4")
- Nail 2" x 4" cross board flush along the top of the spacers to allow a 2" opening along the bottom to allow storm water to access the inlet after being filtered.
- Attach wire mesh along the top of the 2" x 4" cross board to conform with the curb and gutter.
- Apply filter stone the entire length of the cross board.
- Attach the mesh to the top of the cross board to secure the filter stone.
- Attach 2" x 4" anchors on top of each end of the cross board to anchor the inlet protection.
- Use sand bags on top of the 2" x 4" anchors to secure the inlet protection to the structure or drive stakes into the ground at the rear of the structure to attach the 2" x 4" anchors to.

1. All trees to be protected shall be prepared and treated to maximize their potential for survival and improve their health and condition.
2. The location of the tree preservation zone will be flagged for the Town Urban Forester to confirm the clearing limits in relation to those trees identified to be saved.
3. Pursuant to the Town's Design and Construction Standards Manual (DCSM) § 8-410.B, trees being removed shall not be felled, pushed or pulled into trees being retained.
4. Tree protection fencing shall be installed prior to any grading on site and maintained for the duration of the project construction.
5. Tree protection fencing shall be installed in conjunction with root pruning at the limits of clearing. Fencing shall consist of a four-foot (4') high welded wire fence, attached to steel T-bar stakes. Signs prohibiting entrance shall be installed every thirty (30') feet along fencing.
6. Silt fence will be installed wherever potential runoff may cause silt to enter preservation areas. Silt fencing will be coordinated with the erosion and sedimentation control plans for the project.
7. Root pruning shall be to the depth of excavation, or 24 inches, whichever is less. A trencher or vibratory plow shall be used to prune all roots. Roots over two (2") inch diameter shall have a clean cut made on the surface of the root, which is still attached to the tree.
8. A root biostimulant shall be applied according to the manufacturer's recommendations for trees that are root pruned. Biostimulant shall be dispersed using mechanical broadcast equipment.
9. The Town Urban Forester will be contacted 48 hours prior to any grading activity to confirm compliance of the tree preservation measures listed above.
10. All trees with root zones that will be impacted by construction shall be mulched with wood chips from pruning and removal operations on site. Mulch will be four (4") inches in depth. Mulch shall be kept at least six (6") inches from the trunk of all trees.
11. All construction activity within the areas fenced off around the trees shall be prohibited.
12. Contractors and sub-contractors are accountable for observing all tree preservation requirements and for securing permission for any deviation from the approved plans.
